General terms and conditions

All offers, orders and deliveries are subject to the general terms and conditions of Seeh BV, filed at the Chamber of Commerce in 's-Hertogenbosch, as most recently laid down there. The general terms and conditions can be found on our website <https://www.seeh.nl/algemene-voorwaarden>

Explanation glasses

What are computer glasses? The name says it all: prescription screen glasses provide sharp vision behind your computer, tablet, or smartphone. Whatever prescription you have, the special glass allows your eyes to strain less and fatigue less. In addition, the prescription screen glasses ensure that you no longer have a tense posture behind your screen. In short, with screen glasses you increase your own working comfort while working at home or at the office and you prevent or minimise annoying physical complaints.

Single-vision glasses

Single-vision glasses are spectacles for better near vision or for better far vision. Single-vision glasses for near vision have a plus prescription in the lenses. This allows you to see sharply up close, for example to read a book. Single-vision glasses for distant vision have a minus prescription in the lenses. This allows you to see sharply in the distance, for example while driving. So single vision lenses have only one prescription.

Single-vision NeXt

NeXt single vision lenses allow you to see super sharply and comfortably at various (short) distances. NeXt single-vision lenses are suitable for anyone aged 15 to about 40 who spends at least 2 hours a day looking at a screen or performing other work at a short viewing distance.

Multifocal

Multifocal glasses allow you to see well both far away and up close. Multifocal lenses combine different prescriptions in one lens. Depending on where you look in the glasses, you can see very well at different distances: at reading distance, intermediate distance and far away. Without having to change glasses. Multifocal lenses (also called varifocal lenses or progressive lenses) allow you to see sharply both near and far.

As many as 85% of people over 40 need progressive lenses.

Our Indoor multifocal screen glasses

For the Indoor multifocal computer glasses, we have chosen Workforce Nearview, Midview and Longview. These glasses have different prescriptions: for near, intermediate, and far. This ensures that you can sit in a natural position behind your monitor and that you can also perform your other work properly. Basically everywhere.

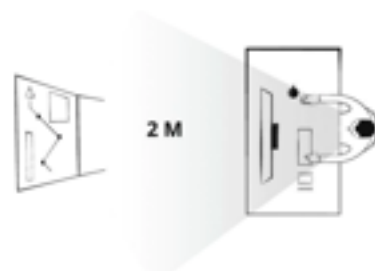

Nearview

- Used for static work
- Reading and monitor work carried out at the same workplace
- Sharp field of vision up to 1 metre

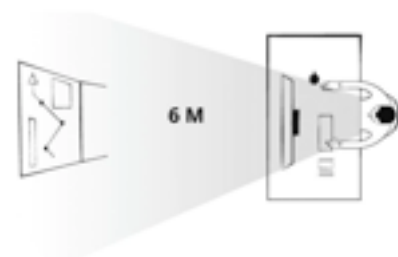

Midview

- Combination of screen work and office work
- Especially at a short distance from the monitor
- Sharp field of vision up to 2 metres

Longview

- Combination of screen work and office work
- Especially at a short distance from the monitor
- Sharp field of vision up to 6 metres

Glass index

By default, the lenses for complete glasses have a lens index of 1.5. The thickness of the lenses depends on several factors, such as your prescription and the size of the frame.

The thinner the glass, the higher the index

Glasses that are somewhat thinner have a higher glass index, between 1.6 and 1.74. For the higher glass index, a surcharge applies. The thinness of your lenses depends on the prescription you need and the material of your frame.

Explanation coatings

You can choose from different coatings for your computer glasses. Below, we explain the function of each coating.

Scratch resistant

Prevents scratches on your glasses

Ultra coating

Ultra-high scratch resistance, Ultra transparent and anti-reflective and Ultra water, dirt, grease and dust repellent

Anti-reflex

Prevents annoying reflections

Blue filter

Filters the blue light

Ultra coating

The best coating for your lenses is our Ultra coating. It makes your lenses super scratch-resistant and anti-static, giving them even better protection against scratches and dirt. Moreover, moisture does not stick to your lens, so your vision remains optimal even when it rains. The new Ultra coating makes your lenses harder and therefore even more scratch-resistant.

- Scratch-resistant, for a long durability
- Dust-repellent, for easy cleaning
- Grease-resistant, for less polishing
- Water-repellent, against staining
- Anti-reflection, for sharp vision
